

Please do NOTHING to further the implementation of BPL at this time without further studies to determine just how harmful the interference of BPL really is to other licensed radio services. PLEASE LISTEN to agencies like FEMA, The United States Military Services, And many others who have grave concerns about how harmful BPL will be to HF radio services. PLEASE listen to the NTIA regarding this matter. Also, I hope the FCC can review it's charter to see if it is really supposed to be a "Cheerleader" for any new service, Or a REGULATOR of existing rules. There are proven ways to deploy broadband services without causing harmful interference to other services (Fiberoptic, Wirless, etc) To promote one provider over others is simply WRONG. The existing systems of BPL deployment in this country have had VERY slanted tests done to determine interference to other services. Where BPL has been deployed in other parts of the world, It is showing itself to be a real interference monster! Some areas have ordered it removed. While it sounds nice to be able to provide broadband services over existing wires, In the real world, This is simply a boondoggle that never will work as advertised. If you really want to assist deployment of broadband to all, Please promote widespread deployment of fiberoptic lines that WILL function properly and not cause harmful interference to many other services.

Thank You.
